

## Challenge the limits of your imagination : How we use TuneFace, Titanium, and Opus

You&Chung Skin Clinic, Seoul  
Woonkyong CHUNG

If I had to characterize the Korean aesthetics market, I would say that one of the characteristics is definitely variation, adaptation, and evolution. With a clear understanding of the intentions of the developer, or the company that developed it, the indications and treatment methods are being refined to better suit the Korean market. And interestingly enough, this is most evident in devices of Alma Lasers.

Overseas, the ultrasound module is the more famous Accent Prime, but in Korea, TuneFace, a radiofrequency device, has become the main handpiece. In addition, Soprano Titanium laser, which was developed as a hair removal device, is being utilized as a skin tightening and lifting device, and this treatment is very popular in Korea recently. The recently launched Opus is also being utilized as a new concept of rejuvenation.

In this presentation, I will introduce these indications and specific treatment methods that are not well known overseas.
