

*Title: Multi-Modality Skin Rejuvenation Combining PicoLO Premium Picosecond Nd:YAG laser with micro focused ultrasound and/or injectables.*

Providing non-invasive skin rejuvenation treatments delivering clinical outcomes rivaling surgical interventions is the aspiration of many of us in the aesthetic dermatology space. This presentation summarizes our work to date combining LASEROPTEK Co. Ltd.'s PicoLO Premium picosecond Nd:YAG laser skin rejuvenation treatments with additional, synergistic modalities, including micro focused ultrasound, and injectables such as fillers and toxins. Our initial work with the PicoLO laser helped us better understand the capability and efficacy of PicoLO facial rejuvenation treatments as a monomodality. The resulting positive clinical outcomes and patient satisfaction motivated us to investigate synergistic combination therapies for both on and off the face. In this presentation we discuss a variety of multi-modality procedures performed in our clinic combining PicoLO Premium multi-depth fractional 1064nm picosecond laser rejuvenation treatments with supplemental energy, and injectable modalities. The positive results continue to motivate us to investigate additional treatments combining PicoLO laser with synergistic adjunctive technologies.
