

Combination treatment for facial rejuvenation by the PCL-based filler, the coned thread and cryolipolysis

Shangli Lin

Shangli Dermatologic & Aesthetic Clinic

In the aging process, every anatomical structure ages differently. To correct aging signs properly and to deliver satisfying result, we should tackle the problems of different anatomical planes with the corresponding methods.

The PCL-based filler is an option we can use to address the facial volume loss and restore the facial proportions; the coned thread is used for facial definition restoration and for correct superficial fat displacement, while cryolipolysis can be used to reduce the submental fat and the heaviness of the lower face.

In my presentation, I will share my personal experience and rationales of combining these methods for facial rejuvenation.
