

Non-Surgical Body Reshaping by Strong Non-Heating Thread

24 June 2023, 12.00 - 12.20, Room Crystal B (Level 3), Session of Next Level of Thread Lift

The human needs for body shape corrections have grown rapidly around the world. The corrections that initially could only be done by surgical method, can now also be done non-surgically, e.g. lifting thread. Certainly, a thread with an exceptional strong tensile strength is needed to provide effective correction to the human body shape.

Non-heating thread is an innovative thread that was developed using a non-heating technology which results in a high-tension capacity up to 5.3 kgs. This newly developed technique was designed using a modern technology in order to reduce the exposure of heat during the manufacturing process.

The thread used for this body corrections is a double needle thread made of bioabsorbable Polydioxanone materials which is equipped with Pyramid cogs design that are very sturdy, precise and tight so it can grip the subcutaneous fat layer very strongly. The body area applicable for this treatment includes Breast, Buttock, Upper arm and Belly. The most common side effects occur after the treatment are pain and dimple/skin folding.
