

PLLA and PDLLA are collagen synthesis stimulators that improving skin elasticity and fine wrinkles, and adding natural volume

They are widely used around the world for the purpose of collagen synthesis. And, Numerous products are used in Southkorea such as Scultra, JuveLook, UltraCol, and Olidia.

HA filler is well known to many dermatologists and is used in many dermatology clinics. But There are many doctors who don't believe effect of collagen stimulator. Furthermore, some dermatologist worry about side effects of PLLA and PDLLA. In addition, many side effects have occurred due to indiscriminate procedures performed without recognizing accurate treatment methods in the initial stage. So, we need safe and effective procedures guidelines for doctors who had not enough experience about collagen stimulators.

Fortunately, doctors and patients' perceptions of collagen synthesis stimulator injections have been changing positively in recent years, and their use has continued to increase in many dermatology clinics. Additionally, prevalence of side effects are decreasing due to improve procedure technique including solution mix technique.

In the case of PLLA, it helps increase natural volume through strong tissue reactions and is also effective in improving skin elasticity. PDLLA is a little weaker than PLLA, but it is developed in a form that can be injected intradermis, which can help improve skin quality directly. As such, each collagen stimulators have their own advantages. There is no literature on cases using two collagen boosters together yet

In this lecture, we will introduce cases of treatment using a combination of PLLA and PDLLA rather than using the existing classic methods of HA filler and EBD to add natural volume and improve skin quality, and show you a video of the procedure.

In addition, we will learn more about side effects such as nodules, which are the limitations of PLLA and PDLLA, and how to prevent and manage them.
