

According to Alfred's study eyes are the first area of the face to draw the gaze of one's attention!

Periorbital areas and eyes have complex anatomical structures, and are usually the first areas of face to show the signs of aging. Tear trough, palpabromalar groove, fine lines, wrinkles, ptosis of eyelids, sunken upper eyelids and eyebags are common periorbital problems.

By using HA fillers and botulinum toxin A properly, we can treat dynamic periorbital wrinkles, tear troughs, improved dark circle and eye bags with tired looking, improve sunken upper eyelids and reshaping the orbital to create youthful and refreshed looking.

This presentation will focus on strategy and techniques about reshaping, beautification and reversal of aging signs over the periorbital region.
