

Title: Neck Bio-Regeneration: Biostimulatory Fillers with EBDs

Melissa Kanchanapoomi Levin

Mount Sinai Hospital Icahn School of Medicine

Abstract: The neck is an integral component of facial aesthetics and often shows clinical signs of aging earlier than other areas. Considering the anatomical differences and frequent neglect of the neck compared to the face, neck rejuvenation techniques may include addressing skin laxity, photoaging, horizontal creases, submental fat, and appearance of platysma muscle bands. This lecture will review the non-surgical approach using a combination of fillers and energy-based devices to offer a comprehensive and effective strategy for addressing the multifaceted signs of aging in the neck region. The precise placement of biostimulatory and hyaluronic acid fillers address skin quality and volume loss, while energy-based devices target skin laxity, wrinkling, and textural irregularities. By utilizing these complementary techniques, clinicals can customize treatment plans to address the individual patient to achieve optimal outcomes.
