Abstract	Cosmetic dermatologic procedures such as botulinum toxin injections, laser/light-based therapy, chemical peels, and fillers can cause ocular complications. These complications include dry eye, blepharoptosis, corneal abrasion, conjunctivitis, and even retinal artery occlusion. To prevent these complications, dermatologists should be aware of the anatomy and physiology of the eye and take precautions such as proper positioning and using protective eye shields. Management of ocular complications involves prompt referral to an ophthalmologist and proper treatment, which may include lubrication, antibiotics, or even surgical intervention. Dermatologists should prioritize patient safety and communicate the potential risks of cosmetic procedures to their patients.
