Stellar M22 Clears The Way To Brighter Skin

The M22 is a multipurpose platform that allows the physician to treat a broad range of conditions. The intense pulsed light component has 9 interchangeable filters, allowing for treatments ranging from acne, red and brown dyschromia, to hair reduction in darker patients. The vascular filter is ideal for treating redness in lighter skinned patients. There are also customizable pulse formats to optimize outcomes, and the application driven menu is helpful for beginners and experts alike. The filters are a changeable in seconds. There are 3 spots sizes, 15 x 35 mm, 8 x 15 mm and a smaller 6 mm tip. This range of spotsizes allows the operator to focus in on specific lesions or to treat large areas quickly. The extended protrusion of the crystal allows for good visibility. The ergonomics of the handpiece are unparalleled, and the graphical user interface is now larger and more intuitive than ever. The 1565 nm fractional handpiece is an ideal complement to the intense pulsed light application, allowing for improvement of fine lines and scars. The third component of the device is the vascular handpiece, allowing for treatment of solitary vessels and angiomas both on and off the face. Finally, there is a Q-switched 1064 nm attachment, which allows for treatment of black tattoos as well as toning of the skin. We will discuss the broad range of applications with this device in detail during the session.
